

ATS 2200 and 4400 Abrasive Removal Solution for Waterjet Cutting Systems

Never shut down production for tank clean outs again. The all new ATS 2200 or 4400 is the perfect way to improve your waterjet operations. Designed to work with 2,200 or 4,400 lb. super sacks respectively, this abrasive handling solution allows you to quickly and easily remove spent abrasive solids from the waterjet holding tank.

Engineered with rigid steel construction and equipped with a Sandpiper HDF2 diaphragm pump, the ATS 2200 provides reliability and durability for many years of use. The pneumatic diaphragm pump runs on shop air, with no additional power needed. The unit also features a patented 6" Cross-Flow Separator design which removes sediment from the water stream before it reaches the pump increasing the removal rate and virtually eliminating maintenance costs and pump repairs. The unique abrasive removal "nozzles" allow for high rates of removal of more than one ton per hour.

The ATS 2200 can be used manually or make sludge removal completely hands free with an optional in-tank pipe kit and cycle timer which are sold separately.
